

Final Summary Report

Food Ordering System — Business Analyst Skill Assessment

1. Project Overview

The Food Ordering System is a web-based system designed to allow customers to register, browse restaurants and food menus, manage shopping cart items, and place food orders online. The system also provides an administrative interface for managing restaurants, menu items, item availability, and orders.

The purpose of this Business Analyst assessment was to analyze the system requirements and produce appropriate business analysis documentation, system modeling, task breakdown, and project planning documents.

2. Business Problem

Customers need a convenient way to browse available restaurants and food items and place orders online. At the same time, administrators require a centralized system for managing restaurant information, menu items, item availability, and customer orders.

The proposed system addresses these needs by providing separate functionality for customers and administrators.

3. Proposed Solution

The proposed solution is a web-based Food Ordering System with two main user roles:

- **Customer** — register and log in, browse restaurants and menus, search for food items, manage the shopping cart, and places orders.
- **Administrator** — manages restaurants, menu items, item availability, and orders.

The system provides an organized ordering process from browsing food items through cart management and checkout to order confirmation.

4. Key Requirements

The major customer requirements identified include:

- Customer registration
- Customer login
- Restaurant browsing
- Food menu viewing
- Food item searching

- Adding items to the shopping cart
- Updating or removing cart items
- Viewing the total price
- Placing an order
- Viewing the order summary
- Receiving order confirmation

The major administrator requirements include:

- Administrator login
- Restaurant management
- Menu item management
- Updating food item availability
- Monitoring orders

These requirements were used as the basis for the system modeling and other Business Analyst deliverables.

5. System Users

The system has two primary actors:

Customer

The customer interacts with the system to discover restaurants and food items, manage their cart, and complete food orders.

Administrator

The administrator manages the information and order-related activities within the system.

6. Major System Functions

The major functions identified during the analysis are:

1. User registration and login
2. Restaurant browsing
3. Menu browsing
4. Food item searching
5. Shopping cart management

6. Total price calculation
7. Checkout and order placement
8. Order summary and confirmation
9. Restaurant management
10. Menu item management
11. Food availability management
12. Order monitoring

A Use Case Diagram was created to represent the interactions between the Customer, Administrator, and Food Ordering System.

7. Work Breakdown Structure

A Work Breakdown Structure (WBS) was prepared to divide the Business Analyst work into manageable activities. The major activities include:

- Requirements Analysis
- System Analysis
- Documentation
- Review and Finalization

The WBS provides a structured breakdown of the activities required to complete the assessment and its major deliverables.

8. Five-Day Project Timeline

The Business Analyst activities were planned across five days:

Day Main Activities

Day 1 Understand requirements, identify stakeholders and user roles

Day 2 Analyze functional and non-functional requirements and business rules

Day 3 Complete the BRD and begin system modeling

Day 4 Finalize the Use Case Diagram, prepare the WBS and timeline

Day 5 Review all documents, perform quality checks and prepare the final submission

This timeline focuses on the Business Analyst activities required for the assessment rather than software development activities.

9. Key Assumptions

The analysis was developed based on the requirements and features provided for the Food Ordering System. The main assumptions are:

- Customers will use the system to browse restaurants and food menus.
- Customers must register and/or log in as required before completing the ordering process.
- Administrators are responsible for maintaining restaurant and menu information.
- Administrators can monitor order-related information.
- Food item availability can be updated by the administrator.
- The system will provide order confirmation after an order is successfully placed.

10. Deliverables Completed

The Business Analyst assessment consists of the following main deliverables:

- Mini Business Requirements Document (BRD)
- Use Case Diagram
- Work Breakdown Structure (WBS)
- Five-Day Project Timeline
- Final Summary Report

These documents collectively demonstrate the analysis, documentation, modeling, and planning activities performed for the Food Ordering System.

11. Conclusion

The Business Analyst assessment provided an opportunity to analyze the requirements of a web-based Food Ordering System and transform those requirements into structured business analysis documentation.

The analysis identified the key stakeholders, system users, business requirements, system functions, and business rules. A Use Case Diagram was prepared to represent the main interactions with the system, while the WBS and five-day timeline provide a structured approach to completing the Business Analyst activities.

Overall, the completed deliverables demonstrate the ability to **understand, analyze, document, model, and communicate business and system requirements** for a Food Ordering System.
